I do not think that the charge is undue, the resources were spent.

I just wanted to ask AWS how come I have never been able to run multiple lambdas in parallel to make my code work faster, throttling limits are quite strict with LLMs. However, in this ur resources.

Just curious about how the event was possible. I am not sure a call with Bytes or yourself can help. Perhaps Bytes knows?

J

Hi Jos,

Thanks for sharing the details.

On AWS contact—since we operate under the PLES arrangement, we go through Bytes for these matters rather than having a direct AWS contact. However, if needed, we can help esc:

For preventing future cost spikes:

- AWS does impose soft concurrency limits, but as you noticed, enforcement isn't always consistent.
- We can implement **EventBridge and Lambda** to monitor unexpected cost spikes and trigger automatic actions (e.g., reducing concurrency).

On auto-shutdown for cost spikes:

- While AWS Budgets can send alerts, they don't automatically stop resources.
- I understand Peter mentioned this isn't possible, but we could explore whether a **Lambda-based mechanism** could help manage non-critical workloads dynamically. It may not b
- Happy to discuss if that would be helpful as unfortunately with this approach above you may need to work within a budget.

Let me know your thoughts, and if you'd like, at your convenience we can jump on a quick call to review options.

Best,

Hi Namdi,

Yes, I spoke to Joris about it:

- I work with Claude, mainly in the US region which has all models available
- I created a cyclic dependency which deployed thousands of lambdas overnight
- Noticed in the morning when the model had spent about \$4k

I have included guardrails so it does not happen again, however I need to create cycles for the code to run well.

Luckily it was detected a few hours later because of the high bill, I do not check the billing daily so it was good it only happened about 10 hours.

Do you have a contact in AWS so I can talk about this?

In the past AWS has capped my usage which means my models take a lot of time to run, more than 4 simultaneous lambdas and I get a throttle error. This time however there was not

I also asked Peter about stopping resources in AWS if the costs shoot up but he says is not possible. Getting an email for going over budget is nice but if you are sleeping is not ideal. Ar

Thank you,

Jos

Hi Josian,

I hope you're doing well.

We've observed a noticeable increase in Claude3 Sonnet costs (see attached) and wanted to bring this to your attention. Additionally, this resource is currently hosted in **us-east-1**, which

We'd appreciate your insights on this and any recommendations you may have.

Looking forward to your response.

Kind regards
