AWS has announced that **Aurora Serverless v1** will reach its **end of life on March 31, 2025**. Starting **January 8, 2025**, customers will no longer be able to create new Aurora Serverless v1 clusters or instances using the AWS Management Console or CLI. To maintain continuity and support, AWS **strongly recommends** upgrading existing Aurora Serverless v1 clusters to **Aurora Serverless v2** before the end-of-life date. [AWS Documentation+1AWS Documentation+2Amazon Web Services, Inc.+2AWS Documentation+2](#)

While AWS typically does not perform automatic major version upgrades due to potential compatibility risks, in cases of major version deprecation, AWS may initiate such upgrades. These upgrades are usually scheduled during the maintenance window specified for your cluster. [AWS Documentation+1AWS Documentation+1](#)

To ensure a smooth transition, it's advisable to plan and test the upgrade process thoroughly. AWS provides detailed guidance on upgrading from Aurora Serverless v1 to v2, which involves creating a provisioned cluster as an intermediate step before converting to Aurora Serverless v2. By proactively managing this upgrade, you can avoid potential service disruptions and take advantage of the enhanced features and performance offered by Aurora Serverless v2.
