

## **AWS Voice of Pioneers: QuickSight, June 2025 - Review**

This document is a follow up from the Voice of Pioneers session you attended on June 6<sup>th</sup>, 2025 in London. The purpose of the document is to recap the event, share the primary learnings we gained from our time with you, and share how we intend to proceed. Once again, we thank you for taking the time to meet with us.

Please remember this document is confidential and we share it with you under NDA. Please do not share this document, the conversations, or the content with anyone in your organization who does not have a need to know or outside your organizations without prior agreement from AWS. Also, any timelines for future features or enhancements are subject to change.

### **1. Event Recap**

---

On June 6th, we brought together 18 attendees from 13 AWS customers in London to meet with representatives from the Amazon QuickSight Service Team. We began the day with an overview of the Voice of Pioneers program and service team structure, followed by comprehensive customer introductions where attendees shared their specific use cases and challenges.

The QuickSight Service Team in attendance (Zac Woodall, Emily Zhu) then presented the product roadmap and recent releases. This was followed by detailed technical sessions covering data preparation, SPICE engine improvements, and direct engagement with customers through group discussions and presentations.

### **2. What We Heard**

---

While our conversations were rich and wide ranging, there were several signals that stood out from the conversations and feedback you provided. Much of the discussion can be grouped into focus areas of 1) Q capabilities 2) data connectivity and preparation 3) enterprise governance and security 4) visualization and user experience.

#### **Customer Introductions, Use Cases and Q in QuickSight Demo**

During the introduction session, we heard diverse use cases across various industries. Some of you expressed interest in schema exploration and data security capabilities, while others highlighted challenges in migration from other BI tools like Tableau to QuickSight. We heard about the need for better data ingestion options, integration requirements with other AWS and Azure services, and specific interests in Amazon Q capabilities.

Several attendees mentioned challenges with pricing structures, API limitations, and permissions setup complexity. We also heard about the need for better documentation on data visualization capabilities and different types of supported visualizations.

During the Q in QuickSight demo presented by RWS Trados, we learned that only 2 companies in the room were currently using Q in QuickSight. We heard that prompting in Q needs to be quite detailed, making it difficult to create visuals sometimes. New updates in January 2025 have created significant improvements to this, and the approach that RWS Trados have taken is to provide sample questions for users to have a starting point.

#### **Product Roadmap Discussion & Latest Announcements**

When discussing Pixel Perfect reports, we found that while most attendees use interactive dashboards, very few currently use Pixel Perfect. However, there was interest expressed for future use cases, particularly for standardized monthly reporting and email reports for UI purposes.

Regarding Custom Agents, we heard interest from attendees. No attendees indicated current usage of Q Business.

For unstructured data capabilities, we heard interest in combining datasets and using data APIs to support customers in getting data from platforms into their own tools. The QuickSight specialist team for EMEA highlighted that Q Index would be well-suited for such use cases. We heard questions about whether unstructured data can be integrated into dashboards and if Q Business can extract semantics from documents rather than just extracting content. The service team introduced Scenarios as a solution for this type of agentic data analysis, which was well-received. With [Scenarios](#), a QuickSight user describes a problem that they want to solve and adds relevant data from QuickSight or from their computer to be used in the data analysis. Alternatively, users can let Amazon Q in QuickSight search for all relevant data that can be used to solve the problem. Amazon Q returns a series of analyses or prompts to dive deeper into the data. Users can also enter their own prompts to create a custom analysis. After a new prompt is received, Amazon Q breaks down the analysis into steps and executes them. Outputs include specific data insights, interactive visuals, and an analysis of what the findings might mean for the business with suggested next actions.

#### **- Visualization and User Experience**

Regarding Highcharts, we heard that some attendees have been investigating its use cases for controls and mappings, while others have conducted internal training sessions and found it useful for charts. For mapping capabilities, we heard concerns that built-in current mapping functionality is quite US-centric and weaker in the UK, with requests for regional improvements. The service team confirmed that improvements for UK mapping should happen this year.

#### **- Enterprise Governance and Security Concerns**

We heard significant concerns about governance, particularly around data control and security. Some of you mentioned that you don't want data distributed in an uncontrolled way, especially when using QuickSight across many AWS accounts for customers. Several attendees mentioned difficulties with VPC endpoint policies. We also heard that deleting users has been difficult in QuickSight, and tracking whether users have accessed QuickSight dashboards has been challenging for policy enforcement purposes. AWS shared that there are currently some pre-built solutions such as the one detailed in [this blog](#), as well as an existing Product Feature Request to identify active and inactive users.

#### **- Multi-Account Strategy and Data Segregation**

We heard from multiple attendees about using multi-account strategies, with some managing hundreds of accounts using a combination of accounts per large customers and groupings for smaller customers. Others described having 80+ accounts with each client having multiple logins (hence multiple accounts) across production and staging environments.

We heard interest in restricting QuickSight website API on VPC endpoints, SPICE ingestion improvements, and more real-time capabilities. Some attendees expressed their desire for QuickSight to identify problems in data streams and know when data is ready for visualization. The QuickSight specialist team for EMEA responded that secure connections can be created to call APIs and refresh SPICE once ETL is complete.

We heard concerns about regulatory requirements necessitating data separation. The service team recommended data segregation approaches, though some expressed concerns that segregation through VPC might introduce complexity and additional security risks.

#### **- Multilingual Support**

We heard from attendees using French, Spanish, German, and Welsh languages. The service team confirmed that more languages are being supported and are currently in development. This is the [current list](#) with languages supported in the QuickSight user interface. This option is set separately for each individual user.

#### **- SPICE and Data Refresh**

We learned that 8-10 attendees are currently using SPICE, with several using Athena as their query engine.

94 We heard strong interest in Incremental Loading capabilities. The service team explained that incremental  
95 loading depends on data temperature - hot data (near real-time) is better suited for direct query, cold data  
96 (rarely accessed) can remain as direct query, while warm data (hourly, daily refreshes) is more strategic to  
97 move to SPICE. The team explained various refresh mechanisms including triggered processes via API  
98 and scheduled refresh options, with full refresh replacing entire datasets and incremental refresh suitable  
99 for time series data with defined lookback windows.

100 We heard requests for incremental retiring of data since the only way this can be done right now is  
101 through full refresh. The service team mentioned that a new feature called data aging is coming, where the  
102 new SPICE engine will allow zero ETL and deleting will be included.

103 We heard about challenges with SPICE refresh scheduling, particularly around resource contention when  
104 multiple refreshes are scheduled at common times like 8 AM, causing excessive load on databases. Some  
105 attendees have implemented manual scheduling jitter as a workaround, though this feels hacky. The  
106 service team acknowledged this resource spike issue and mentioned there is a queueing system to perform  
107 refreshes once resources are freed up. We heard interest in refresh windows instead of exact scheduling  
108 times, and requests for automatic retry functionality when refreshes fail as currently user must manually  
109 retry. The service team confirmed automatic refresh already exists but noted that if it's customer's source  
110 engine problem, it will not retry.

111 We heard requests for APIs to determine why refreshes failed and for automatic one-time retry  
112 capabilities.

113 - **Analytics and Usage Monitoring**

114 We heard interest in built-in usage analytics capabilities within QuickSight instead of relying on  
115 CloudWatch, with desires for SPICE analytics and usage analysis dashboards. Some attendees expressed  
116 wanting QuickSight-native analytics with direct Slack alerts. The service team mentioned that usage  
117 analytics is on the roadmap but not expected this year.

118 - **Data Connectivity and Custom Requirements**

119 We heard requests for more data connectors, including direct connections to Asana and DynamoDB  
120 (instead of through Athena). The service team mentioned that Asana will be available as an unstructured  
121 data connector where users can query but not bring data directly into dashboards.

122 - **Access Control**

123 We heard about column-level security challenges, where users attempted to hide columns based on client  
124 access (e.g., Irish clients seeing only euros, US clients seeing only USD) but found it didn't work  
125 properly. The service team recommended using parameter settings and dynamic content switching based  
126 on parameters instead of column-level security (CLS is mainly designed for security rather than visual  
127 flexibility).

128 - **Data Preparation and Transformation Features, SPICE engine v2**

129 We heard concerns about potential impacts of new data preparation features on existing users who are  
130 already trained on current versions. The service team assured attendees that there will be a grace period  
131 for transitioning to new experiences and that existing dashboards will not be impacted as changes occur at  
132 the data preparation level. We also heard interest in joining large datasets at runtime in SPICE, which the  
133 service team confirmed will be supported in both SPICE and direct query modes.

134 We heard questions about the upgrade path from V1 to V2 SPICE. The service team assured that the  
135 transition will be transparent and seamless with customer notifications, and that regional rollouts will not  
136 be lengthy processes. New data sizes are expected this year, while direct lake (direct connection to  
137 Iceberg data sources) support is targeted for next year. We heard positive feedback about Google Sheets  
138 integration, with attendees excited about the ability to automatically pull changes from sheets into  
139 QuickSight without manual S3 updates.

140

141 **3. What We Learned**

---

142 In addition to the feedback we received regarding Amazon QuickSight, our services, and how we can  
143 better serve you, we also learned about the effectiveness of this type of event and how we can improve in  
144 the future.  
145 The customer satisfaction (CSAT) score (an average of the ratings you provided out of 5 for the event)  
146 was 4.6, which is on the high end and indicates you found significant value from the event (total of 18  
147 respondents). As well, you provided an average score of 4.84 out of 5 when asked about the value of  
148 having service team leadership in the room. This feedback encourages us to continue this series of events,  
149 including direct participation of service team leadership.  
150

151 **4. What's Next**

---

152 Your account teams will schedule a follow up meeting, pending availability, in the next month to review  
153 your specific requests (see Appendix 1 - Product Wishlist) and to address any additional questions that  
154 have arisen since the event. Account teams will seek to include service team members where that is  
155 beneficial. Rather than a one-off engagement, we look forward to this being the start of a conversation we  
156 can continue in the months and years to come.

## Appendix 1 - Product Wishlist

Below is a list of the product requests you surfaced during the event. A reminder that any timelines shared below are subject to change.

| ID | Service                                                                                                    | Status                                                                                                                                                                                   |
|----|------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1  | Auto-save on Datasets                                                                                      | Not on roadmap                                                                                                                                                                           |
| 2  | More Data types                                                                                            | Not on roadmap                                                                                                                                                                           |
| 3  | JDBC Or ODBC driver                                                                                        | Not on roadmap                                                                                                                                                                           |
| 4  | Custom connector                                                                                           | Not on roadmap                                                                                                                                                                           |
| 5  | Snowflake connector                                                                                        | Launched - <a href="https://docs.aws.amazon.com/quicksight/latest/user/connecting-to-snowflake.html">https://docs.aws.amazon.com/quicksight/latest/user/connecting-to-snowflake.html</a> |
| 6  | DynamoDB connector                                                                                         | Not on roadmap                                                                                                                                                                           |
| 7  | Search function for table names in 'add data' journey                                                      | Not on roadmap                                                                                                                                                                           |
| 8  | Change field and legend names per visual                                                                   | Not on roadmap                                                                                                                                                                           |
| 9  | SPICE automatic retry refreshes                                                                            | Not on roadmap                                                                                                                                                                           |
| 10 | Pivot in dataset                                                                                           | Not on roadmap                                                                                                                                                                           |
| 11 | QuickSight data points to trigger webhooks                                                                 | Not on roadmap                                                                                                                                                                           |
| 12 | Ability to Create initial analysis directly from CLI - aka dashboards as code                              | Launched                                                                                                                                                                                 |
| 13 | Service role in API                                                                                        | Not on roadmap                                                                                                                                                                           |
| 14 | API to update PublicSharingEnabled account setting                                                         | Not on roadmap                                                                                                                                                                           |
| 15 | Better Functionality over control, eg) allow the use of “contains”, “like” or wildcard in filters/controls | On roadmap                                                                                                                                                                               |
| 16 | Template for analysis – being able to set default template on console and select when desired              | Not on roadmap                                                                                                                                                                           |
| 17 | More control over tables                                                                                   | Not on roadmap                                                                                                                                                                           |
| 18 | Creating customisable interactive shapes that work with actions                                            | Not on roadmap                                                                                                                                                                           |
| 19 | Filters for relevant values and by analysis when importing visuals                                         | Not on roadmap                                                                                                                                                                           |
| 20 | Versioning on analyses                                                                                     | Not on roadmap                                                                                                                                                                           |

|    |                                                                               |                                                                                                                                                                              |
|----|-------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 21 | Export QuickSight visuals as an image                                         | Not on roadmap                                                                                                                                                               |
| 22 | Hide visuals conditionally                                                    | Launched - <a href="https://docs.aws.amazon.com/quicksight/latest/user/conditional-rules.html">https://docs.aws.amazon.com/quicksight/latest/user/conditional-rules.html</a> |
| 23 | Dashboard and Analysis Lineage in UI                                          | On roadmap                                                                                                                                                                   |
| 24 | QuickSight automatic geocoding based on address and postal code               | Not on roadmap                                                                                                                                                               |
| 25 | Add description to analyses/dashboard                                         | On roadmap                                                                                                                                                                   |
| 26 | Collapse/Expand Visual                                                        | Not on roadmap                                                                                                                                                               |
| 27 | Replace the dataset used in a visual                                          | Not on roadmap                                                                                                                                                               |
| 28 | Multi-select for duplicating to another sheet                                 | Not on roadmap                                                                                                                                                               |
| 29 | Slider filters for data type beyond integers                                  | Not on roadmap                                                                                                                                                               |
| 30 | Select time period comparison in a dashboard                                  | Launched                                                                                                                                                                     |
| 31 | Ability to duplicate entire analysis (directly)                               | Not on roadmap                                                                                                                                                               |
| 32 | Add tooltips on all visual types and add the text description to the tooltips | Not on roadmap                                                                                                                                                               |
| 33 | Dashboard timezone                                                            | Not on roadmap                                                                                                                                                               |
| 34 | Multi-language dashboard/localization                                         | On roadmap                                                                                                                                                                   |
| 35 | Topic Selector for Q                                                          | On roadmap                                                                                                                                                                   |
| 36 | Modify and add actions to visuals returned by Q                               | Not on roadmap                                                                                                                                                               |
| 37 | Export dashboards to PowerPoint                                               | Not on roadmap                                                                                                                                                               |
| 38 | Allow customer emails for alert notifications                                 | Not on roadmap                                                                                                                                                               |
| 39 | Usage Statistics (Native)                                                     | On roadmap                                                                                                                                                                   |
| 40 | Calculated Fields Syntax                                                      | Not on roadmap                                                                                                                                                               |
| 41 | Remove inactive users/authors or billing for inactive users                   | Not on roadmap                                                                                                                                                               |
| 42 | Custom error handling rather than generic “No Data” message                   | Not on roadmap                                                                                                                                                               |
| 43 | Allow use of own IAM rule instead of service rule programmatically            | Not on roadmap                                                                                                                                                               |

|    |                                            |                |
|----|--------------------------------------------|----------------|
| 44 | CloudFormation template to create accounts | Not on roadmap |
| 45 | CloudFormation to create analysis          | Not on roadmap |
| 46 | Create users in bulk                       | Not on roadmap |
| 47 | Cross AWS account users                    | Not on roadmap |
| 48 | Search by ID in asset management           | On roadmap     |

## 162 Appendix 2 - Other Action Items

163 Throughout the day we did note other action items, such as follow ups on specific topics with deeper  
164 dives, as well as arranging early access to certain features as they are being developed. For these we will  
165 work with the respective customer and their AWS account team to ensure that they are actioned  
166 appropriately.
